Derived: what follows from the axiom, the compendium's definitions and the read cap $d_1 d_2 \leq 6$, which the alpha Letter obtains from one reading of the axiom's last clause.

Conjectured: the sector of physics each genre is taken to correspond to, and the particles named in its webs.

the smaller end →

the larger end ↓ | d = 1 | qubit, d = 2 | qutrit, d = 3 | ququart, d = 4

the read cap, $d_1 d_2 \leq 6$, from a reading of the axiom

excluded at the axiom: a one-dimensional end is not entangled (theorem 2.9)

qubit
d = 2

qutrit
d = 3

ququart
d = 4

(2,2)

qubit – qubit

$d_1 d_2 = 4$ · readable: one read fixes it

no acting central charge
57 records at two reads
Part VI of the compendium

CONJECTURED

Spacetime

In the webs: the qubit pair of every hub assembly; the serial (2,2) chain is the worldline, and the frame sits at a qubit end.

(3,2)

qutrit – qubit

$d_1 d_2 = 6$ · readable: one read fixes it

the central charge acts
172 records at two reads
Part VII of the compendium

readout $(79 + 48\sqrt{2} + 42\sqrt{3} + 3\sqrt{6})/31104$ = 1/137.035 999 190…, checked in Lean

CONJECTURED

Electromagnetism

its readout is α(0): the Letter's conjecture

In the webs: all five links of the photon word; the docks of the electron, the muon and the quarks; the read lines of the W and the Z.

(3,3)

qutrit – qutrit

$d_1 d_2 = 9$ · dark: no single read fixes it

no acting central charge
392 or 412 records at two reads
Part IX of the compendium

CONJECTURED

Strong interaction

In the webs: the gluon word; the core triangle of the electron, muon and tau; the proton's three junction legs.

(4,2)

ququart – qubit

$d_1 d_2 = 8$ · dark: no single read fixes it

the central charge acts
417 records at two reads
Part VIII of the compendium

CONJECTURED

Weak interaction

In the webs: the legs of every hub assembly; the adapter legs of the W and the Z.

(4,3)

ququart – qutrit

$d_1 d_2 = 12$ · dark: no single read fixes it

the central charge acts
777 or 797 records at two reads
Part X of the compendium

CONJECTURED

Yukawa sector

In the webs: the in-leg that joins each hub assembly to its qutrit.

(4,4)

ququart – ququart

$d_1 d_2 = 16$ · dark: no single read fixes it

no acting central charge
1365 or 1455 records at two reads
Part XI of the compendium

CONJECTURED

Higgs

In the webs: the Higgs word, a single (4,4) pair; the hub-to-hub leg of the top and the bottom.

How to read this chart

Each cell is one genre, written with the larger end first; the upper triangle would repeat the lower one.

The upper part of each cell is derived. Light cells are readable: under the read cap, one read fixes the link. Dark cells are not: no single read fixes them.

The amber band is conjectured. It names the sector of physics each genre is taken to correspond to, as in the compendium's abstract, and where the genre appears in the particle webs, whose identifications with particles are conjectures too.

Of the two readable genres only (3,2) has an acting central charge. Its readout is the alpha Letter's exact number, checked in Lean; that the number is α(0) is the Letter's conjecture, and the measured digits of α(0) test it.
